

I Wonder Why?

Date - 9.12.24

1. Why do we have to eat?

We have to eat to keep our body active and to do work properly. If we did not eat, we could not keep our bodies alive, we could not grow, we would not have energy, and various parts of our bodies could not function as they must.

2. Why do some people wear glasses?

There are many different medical reasons for people who wear glasses, but the simple answer is that glasses help people to see better. Some people wear glasses for reading things that are far away or for driving.

3. What is yeast?

Yeasts are microscopic, single-celled organisms belonging to the fungi kingdom — the taxonomic group that also includes mushrooms and mold.

4. Why is ocean water salty?

Ocean water contains lots of different mineral salts. These salts enter the ocean through rivers, which pass over rocks and soil, picking up salt along the way. This salt builds up in the ocean. And when the water evaporates it doesn't take the salt with it.

5. How come you press harder on a remote control when you know the battery is dead?

It is because applying the extra pressure to the remote will increase pressure applied to the battery, causing there to be a higher probability of the functioning of the remote.

6. **Why do they put Braille dots on the keypad of the drive-up ATM?**

The ATM machines are also used by blind people. The same keypads that work on a normal ATM are used in the drive-thru ones. It wouldn't be cost effective to make separate ones without the braille.

7. **Why doesn't the glue in the bottle dry up?**

Glue is made up of a substance that sticks to things and a solvent that keeps it liquid until you want it to stick. Glue can only dry if the water it contains is able to escape into the air as it evaporates.

8. **Why is it that rain drops down but snow falls down?**

Rain is a liquid so it is heavier than air. It would drop through the air whereas snow, even though it is composed of water, is in a solid state so it would fall because of the solid state of the water.

9. **Why do tears come out of our eyes when we cry?**

Lots of hormones are produced by our body. When we become upset, our brain and body over-react and work fast by producing extra hormones in the form of tears. That's why tears come out of our eyes.

10. **How will you describe memory?**

Can you recite the alphabet easily and quickly? Can you write your name easily? You would probably say that you memorized all this. But what you actually did was learn them. So memory can be described as learning by means of forming habits.
