Tender Heart High School

Class: VII   Subject: Computer   Date-20.01.2025

Topic: Using lists, images and links   Teacher: Prabhdeep

Ch:9 - Using list, Images and links

INSERTING IMAGES

On webpage along with text, you can display charts, maps, graphics, drawings or images also. These elements make the web page more appealing. Images can also be used as navigational tools to help users browse through the Internet. The most used formats are GIF, PNG and JPG formats. Web browser support various other graphic formats also such as BMP, SVG PNG ICO.

Image: An Image is a visual representation of something or you can say an image is a picture that has been created or copied and stored in electronic form. There are two types of images

Inline image: The inline image is displayed when the web page is opened and inserted within a line of text that means Inline Images are Images embedded in the text. The image will flow as if it were part of the text. Images supplied for Back Text Design and formatting books should be supplied inline.

The IMG tag is used to insert images within text. Note that the IMG tag is not a block tag by itself, so it must be used only within a block element.

Ch:9 - Using list, Images and links

External Image : External images are not displayed automatically with other content on the web page. Instead, they are referenced externally and viewed separately by clicking on the link. To insert an external image, the anchor tag <A> is used, that establishes a link to the image.

Students, I am concluding the lesson with this topic. you are advised to read the assignment carefully and remember the tags used.

            Thank you
